

StuDen V1.0

Updated Software Requirements Specification

Version: 1.1 **Scope:** V1.0 update **UI:** Black + White

1. Product Overview

StuDen is a student-focused marketplace and professional identity platform where students can present skills, projects, credentials and services, discover opportunities, and connect with other users. A single User can both offer services and request services; separate buyer and seller accounts are not used.

V1.0 focuses on student identity, portfolio credibility, service discovery, connection and booking requests. Payments, commissions and transaction settlement are deferred.

2. V1.0 Goals

- Allow students to create a credible professional/service profile.
- Present skills, education, certificates and previous work.
- Support technical, creative, tutoring and physical/in-person student services.
- Allow users to discover services and send booking requests.
- Allow users to communicate through StuDen messaging.
- Automatically create a public, shareable StuDen profile when a student creates a portfolio.
- Provide a downloadable/shareable profile card to support organic growth.

3. User Model

StuDen uses one User entity. The same account can request services in one context and offer services in another. There is no role switching and no duplicate buyer/seller account.

4. Student Profile and Portfolio

- Basic account/profile information.
- Student Portfolio with headline, about information and academic/profile details.
- University/college, course/degree and graduation information.
- Location and availability where applicable.
- Education history.
- Certificates/credentials.
- Skills, implemented in the skills phase.
- Showcase media including images and videos, implemented in the showcase phase.

5. Supported Student Service Types

The architecture must not assume that every student is a developer. The same portfolio model should support:

Area	Examples
Development	Web/app development, Java, Python, SQL
Design	UI/UX, graphic design, presentations
Video & Content	Video editing, content creation, reels

Area	Examples
Photography	Photography, photo editing
Tutoring	School subjects, coding, German, IELTS
Music	Singing, instruments, music lessons
Dance	Dance classes and performances
Fitness	Training and fitness services
Creative	Crocheting, handicrafts, calligraphy, mehendi, makeup, nail art
Professional	Voice-over, translation, data entry, virtual assistance
Modelling	Student modelling, fashion, photoshoots, runway
Physical / Event	In-person classes, events and physical services

6. Automatically Generated Shareable Student Profile

When a student creates a Student Portfolio, StuDen should automatically make a public, shareable representation of that profile. This is part of V1.0 and is intended both as a student identity feature and as an organic growth mechanism.

6.1 Public Profile URL

- Generate a stable public slug or identifier.
- Provide a public URL such as `studen.app/u/{slug}`, using the final production domain.
- Prefer a public slug/identifier instead of exposing internal database IDs.
- The public page contains only information intended for public viewing.
- The link can be copied and shared on LinkedIn, Instagram, WhatsApp, resumes and other channels.

6.2 Automatically Generated Profile Card

StuDen should automatically generate a clean profile-card representation from the student's actual profile data. V1.0 does not require a card editor or Canva-style customization.

- Profile photo, where available.
- Student name.
- Headline or service identity.
- Relevant skills/service highlights.
- Optional public location.
- StuDen branding.
- Public profile URL.
- Clear call to view the full profile.

6.3 Sharing Actions

- Copy public profile link.
- Download the profile card as an image.
- Use native device/browser sharing where supported.
- Provide convenient LinkedIn/WhatsApp sharing where technically supported.
- For platforms without a suitable direct-share mechanism, allow link copying or card download.

6.4 Growth Loop

Student creates profile → StuDen generates a shareable identity → student shares it externally → viewers visit the public StuDen profile → viewers discover StuDen and may become users. This feature is intended to reduce dependence on paid acquisition alone.

7. Public Profile Privacy

- Never expose passwords, password hashes, JWTs, database credentials or security information.
- Only publish fields designated as public.
- Do not expose private contact information unless explicitly marked public.
- Public access never grants permission to edit the profile.
- Profile editing remains protected by JWT authentication.

8. Skills and Showcase

- Students can select relevant skills.
- Students can upload evidence of previous work.
- Showcase supports images, videos, project descriptions and external links where appropriate.
- The system must support both technical projects and creative/physical skills such as crocheting and modelling.

9. Marketplace and Booking

Students with portfolios can create service listings. Other users can discover services, view the provider's profile/showcase and send a booking request. V1.0 uses a request flow rather than immediate payment.

Core flow: Explore → Search → View Service → View Student Profile/Showcase → Send Booking Request → Accept/Decline → Messages → Complete.

10. Payments and Reviews

Payments, commissions, orders, payouts, wallets and escrow are explicitly outside V1.0. Reviews and ratings are also outside V1.0. These can be evaluated after validating marketplace usage.

11. UI Direction

- Minimal, clean, Apple-inspired visual language.
- Primary colors: white and black.
- Subtle gray only for borders, dividers and secondary surfaces when needed.
- No orange accent.
- No blue/purple gradients.
- Avoid excessive decorative elements.

12. Backend and Security

Backend: Java, Spring Boot, Spring Data JPA/Hibernate, PostgreSQL, Spring Security, JWT, validation and Flyway. Use feature-based architecture. Use DTOs rather than exposing JPA entities directly. Use environment variables for credentials and secrets.

- BCrypt or equivalent secure password hashing.
- Stateless JWT authentication.
- Server-side ownership checks.
- No plaintext credentials in source control.

- Consistent API errors.
- A single User entity; no BuyerProfile/SellerProfile.

13. Core Database Entities

- User
- StudentPortfolio
- Skill
- UserSkill
- Education
- Certificate
- ShowcaseItem
- Category
- Service
- ServiceSkill
- ServiceImage
- SavedService
- BookingRequest
- BookingAttachment
- Conversation
- Message
- Notification
- Report

The shareable profile can use User + StudentPortfolio with a public slug/identifier. The finalized ERD and API contract must be updated to match the chosen implementation before the share feature is coded.

14. Development Sequence

Phase	Scope	Status
1	Backend foundation + PostgreSQL	Complete
2	Authentication + User	Complete
3	Profile + Portfolio + Education + Certificates	Current
4	Frontend foundation + core UI	Next
5	Skills + Showcase + media	Planned
6	Services / Marketplace	Planned
7	Booking Requests	Planned
8	Messaging	Planned
9	Notifications + Reports	Planned
10	Testing + polish + deployment	Planned

15. Shareable Profile API Direction

The API contract should be updated before implementation to include the public profile/share feature. A recommended direction is:

- GET /api/v1/public/profiles/{slug} — public profile retrieval.
- GET /api/v1/portfolio/me/share — authenticated share metadata/link.
- The downloadable card can initially be generated client-side or through a dedicated media-generation service later.

The exact endpoint names and response schemas must be reconciled with the existing API contract before Claude implements this feature.

16. Scope Status

Updated V1.0: automatically generated public/shareable student profiles and downloadable profile cards are included. Payments, reviews and advanced card customization remain outside V1.0.

The SRS, ER diagram and API contract should remain synchronized. Any architectural change must be reflected in those source-of-truth documents before implementation.
